Department of Agronomy

2009 PEPS Executive Summary

This year marks the 23rd year of the Wisconsin PEPS program. The objectives of the program are:

1. To recognize the practices utilized by the *most profitable* growers and to provide other growers, educators, and researchers insight into ways these producers integrate practices into a system, and
2. To emphasize soil and water conservation, efficiency, profitability and competitiveness vs. productivity alone.

The PEPS program goes beyond typical yield contests by encouraging efficiency and profitability rather than productivity alone. In 2009, a new award called the “Green Fields – Blue Waters” Award, was given to the grower best representing the use of sustainable production practices involving scouting, field management, pest management, and soil and water quality management. The award is determined by a committee of Wisconsin Corn Grower Association Board of Directors

During the first 10 years of the program (1987 to 1996), contestants were ranked on *lowest cost per bushel*. From 1997 to 2008, contestants were ranked on the *greatest return to management* to better account for trade-offs between yield and production costs. In 2000, participants received both a summary of their management costs and a history report detailing costs in various categories over time to assist in “fine-tuning” their management. Beginning in 2009, we again rank contestants on *lowest cost per bushel*.

During 2009, 16 contestants entered 23 corn fields. The average yield in the cash corn and dairy/livestock corn divisions was 214 and 194 bushels per acre with production costs of \$531 and \$428 per acre. The average cost per bushel was \$2.51 and \$2.19. Using PEPS production costs for an acre and the WI USDA average of 153 bushels per acre, the average cost per bushel was \$3.47. It cost \$734 per acre to grow corn silage with an average cost per ton of dry matter of \$81.95 (\$28.68 at 65% moisture).

These costs include actual figures provided by contestants. *These costs do not include all costs of production*. For example, overhead or miscellaneous costs associated with operating a farm (i.e. field tiling, outfitting a shop, plowing snow, maintaining fences, taxes, desktop work related to management, etc.), are difficult to determine among farms, and is not accounted for in the PEPS program. Typical overhead rates range from 18-46% of production costs.

“Best of the Best” aptly describes the farmers participating in PEPS. Results reflect the efforts and costs of some of the best farmers growing corn on the best land available using their best management practices. Lower yielding fields are often not entered into the contest. Thus, “real world” costs are probably higher for most farmers.

We hope these results provide some ideas to improve corn production efficiency and profitability. More importantly, this report may provide some good points for discussion.

2009 PEPS Procedures

The procedures used to calculate production costs and cost per bushel are hopefully self-explanatory from the enclosed PEPS budget summary sheet. The actual budget summary and history report is provided to participants only. You should notice the following in particular:

1. Grower return was calculated by multiplying commodity price with yield and subtracting production costs. Corn price was determined using a marketing strategy when 50% of the crop was sold in November and 25% forward contracted (less basis) to March and July respectively. The November average cash price was derived from Wisconsin Ag Statistics, and the March and July future prices were derived from the Chicago Board of Trade closing price on December 1.
2. Many costs (seed, herbicides, insecticides, insurance, scouting, etc.) were charged based on the figures provided to us by participants.
3. Nitrogen and micronutrient fertilizer costs were those provided, unless N analysis was unknown. If fertilizer was applied, and N analysis was unknown, N costs were based on removal at the grain yield obtained. All P and K costs were based on removal at the grain yield obtained. Starter and other mixed nutrient fertilizer costs were based on N and/or micronutrients only; P and K costs per unit, as a percentage of total applied fertilizer, were subtracted.
4. Equipment costs were based either on actual custom machinery hire, or on figures in the publication, "Minnesota Farm Machinery Economic Cost Estimates for 2007", for individual operations. (Please let us know if you would like a copy of this publication). We matched listed machinery size and type with the most appropriate categories in the publication.
5. Harvesting costs were estimated for handling (\$0.02 per bushel), hauling (\$0.04 per bushel), trucking (\$0.11 per bushel) and storage (\$0.02 per bushel month with 25% of grain shipped in March after 4 months storage and 25% of grain shipped in July after 8 months storage). Drying costs in the cash crop corn division were estimated at \$.02 per point above 15.5% per dry bushel.
6. Milk price was determined using a marketing strategy of monthly forward contracts between December and September (less \$1.25 basis). The October and November average cash milk price was derived from Wisconsin Ag Statistics, and monthly futures prices were derived from the Chicago Mercantile Exchange closing prices on December 1. Harvesting costs were estimated for handling (\$0.75 per T DM), hauling (\$1.50 per T DM), packing or filling (\$0.50 per T DM) and storage (\$1.00 per T DM, and silage loss during storage of 15% of yield.
7. Land costs were based on the average of: a) 50% of the NRCS-rated corn yield potential for the soil type involved, and b) estimated cash rent. The 50% figure was derived from participant's estimates of average cash rents for land similar to the contest plot.
8. No one was disqualified for soil loss greater than "T", however soil loss in tons/acre is reported on the overall summary sheet.
